

RESEARCH PROFILE

PhD researcher in Electrical Engineering at IIT Bombay working on Home Energy Management Systems (HEMS) for residential buildings. My research combines optimization, forecasting, data-driven methods, and physics-based modeling for battery-aware energy scheduling, demand response, and flexible cooling loads. I am interested in applying AI and data-driven methods to strengthen forecasting and control in flexible, grid-interactive residential energy systems.

RESEARCH INTERESTS

- Home Energy Management Systems (HEMS)
- Energy Forecasting
- AI and Data-Driven Energy Systems
- Optimization and Scheduling
- Battery Energy Storage
- Battery Degradation Modeling
- Demand Response and Demand Flexibility
- Smart Buildings and HVAC Control
- Smart Meter Data Analytics
- Renewable Energy Integration

EDUCATION

Dec 2023 – Present	PhD in Electrical Engineering <i>Indian Institute of Technology Bombay (IIT Bombay)</i> Focus: Battery-aware HEMS Optimization, Energy Scheduling, Demand Response Flexibility. Advisor: Prof. Anupama Kowli
2021 – 2023	M.Tech in Power Systems <i>National Institute of Technology, Kurukshetra</i> Thesis: Short-Term Forecasting for Power System Operation. Advisor: Prof. Saurabh Chanana
2015 – 2019	B.Tech in Electronics and Electrical Engineering <i>Kalinga Institute of Industrial Technology, Bhubaneswar</i>

RESEARCH EXPERIENCE

PhD	Residential AC demand flexibility <i>IIT Bombay</i> - Experimental and simulation-based assessment of residential AC demand flexibility using inverter and non-inverter systems under Mumbai’s tropical humid climate. - Developing a hybrid data-driven and physics-based inverter AC model, combining data-driven parameter identification with an equivalent thermal parameter (ETP) framework.
PhD	Battery-aware HEMS scheduling <i>IIT Bombay</i> - MILP-based HEMS scheduling integrating PV, battery, EV, and grid interaction, with multiple battery degradation formulations (quadratic, DoD-based linear, net-load-factor-based dynamic). - Multiobjective optimization balancing energy cost and battery degradation using weighted-sum and AUGMECON epsilon-constraint methods, including Pareto front and knee-point analysis.

Aug – Dec 2023

Real-time HEMS simulator

Project Research Associate, IIT Bombay · with Enphase

- Developed a Python-based real-time simulator for Home Energy Management Systems.
- Integrated distributed energy resources including PV, battery storage, SG-ready heat pumps, electric vehicles, residential loads, and grid interaction.
- Modeled Li-ion battery operation under constant-current/constant-voltage (CCCV) and constant-power charging and discharging modes.

2021 – 2023

Load and price forecasting

M.Tech, NIT Kurukshetra

- Developed LSTM and GRU recurrent neural network models for short-term electricity-load forecasting and electricity market clearing price prediction.
- Investigated the effect of training optimizers, including Adam, Nadam, SGD, and RMSprop, on forecasting performance.
